ABSTRACT

The article provides an analysis of various factors affecting attitudes towards health of both young people and adults, in particular, attitudes towards bad habits. Human health is a complex category and has many definitions, for example, the World Health Organization (WHO) defines individual human health as a state of complete physical, mental and social well-being (not only the absence of illness or illness). Traditionally, all issues related to the level of the nation's health are attributed to the health sector. However, modern scientific studies indicate a significant expansion of the range of factors that affect the health of the population, but are not controlled within the framework of the health care system.
