ABSTRACT

The role of personal subsidiary farming in the last decade has proved to be very significant in the food and financial provision of the population. At the same time, taking into account the differentiation of both collective and personal farms that has occurred in recent years in connection with the reform of agricultural enterprises, the nature and capabilities of personal subsidiary farms in different conditions differ significantly. Currently, there can be several views on the prospects for the development of the agricultural sector of the population among agricultural scientists. All of them are interconnected and complement each other. Different opinions of the same scientist may belong to different groups. The grouping of views was carried out in order to better and more accurately determine the prospects for the development of PSF.
